

The reseedling is blown widely between the tines into the open soil and rolled in for to achieve the necessary soil contact.

HarroFlex with broad seed. Proven since 2005.

So that the seeding arrives safely the soil, the turf shouldn't be too long. Has the old stock already sprouted too much, there is a danger that a good part of the seed will get stuck in the turf, „between heaven and earth“, and thus cannot establish itself and will be lost.

As soon as additional dew comes into play, the grass seeds really glue on the wet stems and make reseedling even more difficult.

Farmers who have their own equipment, usually will be careful, to reseed on time.

In inter-farm use, however, there will always be situations in which the turf has already sprouted too much. Be it that the respective farmer has decided too late for reseedling, be it that the machine has to process too many orders.

The following GÜTTLER® roller ensures with its golden hoof effect a perfect soil contact.

The roller with the „Golden Hooves“

Even our grandfathers knew it:
„The hoof steps of the animals during grazing

- creates a denser turf
- bring the reseedling safely to the soil!“

The GÜTTLER® roller with 305 prism points per square meter have the same effect as a passing flock of sheep – it's your benefit!

**The rollers with the
„Golden Hooves“**
The Original. Since 1978

NEW

HarroFlex 600 with tine seed

The new „tine sowing“

All harrow tines are provided on their back with seed lines that bring the seed safely to the ground even with higher grasses

This extends the time period in which a reseedling can be successfully carried out!

Precision seeding and broadcast seeding combined!

The seed is conveyed in the air stream. A part of the seeds thus bounces off the soil and is also distributed between the rows as broadcast seed.

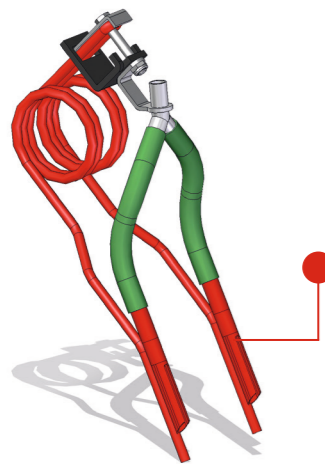

An European patent

The new GÜTTLER tine sowing is based on a granted European patent and was thoroughly tested by contractors over a long period of time.

The technology will be available from May 2020.

HarroFlex 600 tine seed

Working width 6 meters
80 harrow tines = 7.5 cm tine spacing
80 seed tubes = 7.5 cm row spacing!

Tine seed a world innovation

Seeding lines on all harrow tines
